Suppose I have a local library with local variables like this: const Counter = Symbol("Counter") class CounterClass { constructor() { this[Counter] = 0 } increment() { this[Counter]++ } decrement() { this[Counter]-- } } I want to use the same library to create a generic class named Item, which takes a variable called itemIndex as a constructor parameter: class Item { constructor(index, itemIndex) { this[itemIndex] = index } fetch() { // how to get the local variable itemIndex in this function? // using this.itemIndex or this[itemIndex] is not working, // since itemIndex is a local variable. this.itemIndex } } export default Item export * from "/Item" The same problem comes to action hooks like useEffect, useMemo, useRef and others. The question is: How to get a local variable value in a hook in a remote server when using Git? A: I had a similar problem in the past. The good news is that you can share all the dependencies with all the clients, i.e. for example the client can use itemIndex directly: export class Item { constructor(index, itemIndex) { this[itemIndex] = index } fetch() { this[itemIndex] } } export

What's New in the?

Graphical user interface (GUI): Several of the design tools have been improved: A new Measure dialog window displays the measurement result without the need to use the ribbon to measure. The canvas automatically updates when measurements are made. And all AutoCAD documents can be saved in native AutoCAD-engine PDF format. (video: 1:13 min.) Ability to open drawing files in the correct project: AutoCAD has been updated to automatically display and work with drawings from the same project, in addition to the traditional and recently added drawing support for drawings in existing projects. (video: 1:11 min.) Reduced memory and performance impact on large files: AutoCAD has been upgraded to use in-memory blocks instead of the previously allocated file. This enables AutoCAD to handle large drawing files without noticeable performance issues. 3D Modeling: New ability to dynamically model and export 3D models. Cloud storage and collaboration: The Windows client now supports file uploads to the cloud. You can also import and export 3D models using the cloud-based service Sketchfab. AutoCAD 2023 will also be the first release of AutoCAD that integrates with the Microsoft 365 cloud offerings: AutoCAD can store and share your drawings on Microsoft 365 OneDrive. (video: 0:57 min.) Geospatial: Updated GeoPackage support in AutoCAD. GeoPackage is a native file format for storing spatial data. This is one of the main means of storing geographic information in OpenDocument files, and it is now fully supported in AutoCAD for editing spatial data. Improved CALS support: Improvements in the handling of coordinate systems and elevation. The CALS property of objects and layers has been extended to automatically calculate the coordinates and elevation of the CALS. And with the CALS property set to CALS, the CALS information is now automatically calculated when the drawing is imported from other CAD systems. Improved support for AutoCAD 2D, AutoCAD LT and other plug-in files. For a list of the additional features in AutoCAD 2023, please visit the AutoCAD 2023 release notes. Changes in AutoCAD 2020 Revised dual image support: You can now have 2 layers on the canvas showing 2D drawings. The layers can be
