Severe obesity in severely disabled children: a five-year follow-up study. To study the effect of severe obesity on the functional and health status of severely disabled children and their families. The records of all severely disabled children attending a clinic in a northern Dutch town were reviewed from 1991 to 1996. Those patients with severe obesity (weight for age  $>3$  SD) were contacted five years later. Changes in their functional status and health were compared with those of a matched control group without severe obesity. A total of 50 patients with severe obesity were identified, 20 of whom participated in the follow-up study. No statistically significant differences were found between these patients and their controls. The majority of the patients with severe obesity had extreme functional problems and some
